**GPTutor: Interactive Learning with Structured Debugging Feedback** Prototyping with LLMs

Ruoxi Shang Spring 2023

Background

# Learning Barriers and Pain Points for Coding

#### 

Understanding complex programming concepts Lack of immediate help from experienced mentors

Hit-or-miss process of debugging

Lack of motivation to learn about "why"

### **Related Work** Examples of Debugging Support

HelpMeOut by Hartmann et al. 2010

A social recommender system that aids the debugging of error messages by suggesting solutions that peers have applied in the past

Figure 2. The HelpMeOut Suggestion Panel shows possible corrections for a reported compiler error.

#### StratCel by Grigoreanu et al. 2010

A strategy-based add-in for Excel that automatically generating a list of to-do items and providing actions related to managing a task list

Figure 1. (a) The to-do list task pane is automatically populated with consolidated items and their properties (e.g., worksheet name, a default item name). The user can mark each item as "done" (e.g., Total Points\_1), "unchecked" (e.g., GPA), or "to-do" (e.g., Average 8). Other basic to-do list management capabilities include adding a comment, (b) filtering on a status, and (c) assigning priorities to items (the darker the yellow, the higher the priority).

### **Problem Scope** Overview

- Facilitate a learning environment that encourages users to value iteration, experimentation, and feedback as essential components of the problem-solving process.
- Support learners with **functional** and performance issues for short, isolated coding problems.

Given an array of integers nums and an integer target, return indices of the two numbers such that they add up to target. Given two strings s and goal, return true if you can swap two letters in s so the result is equal to goal, otherwise, return false. Given an integer array nums, rotate the array to the right by k steps, where k is nonnegative.

# Target Users Novice Programmers & Experienced Programmers

Exploring new programming languages or frameworks

Running into issues when working on a project on their own

Self-taught programmers looking to learn a specific skillset

Practicing difficult problems in preparation of job interviews

**Experienced Programmers** 

### Features and functionalities Jupyter Lab Integration

- Jupyter Widget API framework for easy tooling extensibility
- Iterative code experimentation with failure-driven learning paradigm

### Features and functionalities Contextualized and Structured guidance

- Diagnostic questioning targeting specific code constructs and runtime behavior
- Step-wise reasoning decomposition
- Progressive hint escalation based on error classification
- Guided debugging through Socratic dialogue

**Hint 1:** Are you looping through the array more than once?

**Hint 2:** Are you checking if the two indices you are comparing are the same?

**Hint 3:** Are you checking if the sum of the two indices you are comparing is equal to the target?

**Solution:** The current code is not optimal because you are looping through the array more than once. To optimize the code, you should use a single loop and use a dictionary to store the indices of the numbers that you have already seen. Then, you can check if the difference between the target and the current number is in the dictionary. If it is, then you have found the two indices that add up to the target.

Hint 1: Have you considered the case where the same element is used twice?

**Hint 2:** Are you sure that the loop is iterating over the correct elements?

**Hint 3:** Are you sure that the loop is iterating over the entire array?

**Solution:** It looks like your code is not considering the case where the same element is used twice. You need to make sure that the loop is iterating over the entire array and that the two elements you are comparing are not the same. You can do this by adding an additional condition to your loop that checks if the two elements are not the same.

Standard Prompting	Chain-of-Thought Prompting
Model Input	Model Input
Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?	Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?
A: The answer is 11.	A: Roger started with 5 balls. 2 cans of 3 tennis balls each is 6 tennis balls. $5 + 6 = 11$ . The answer is 11.
Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?	Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?
Model Output	Model Output
A: The answer is 27. 🗙	A: The cafeteria had 23 apples originally. They used 20 to make lunch. So they had $23 - 20 = 3$ . They bought 6 more apples, so they have $3 + 6 = 9$ . The answer is 9.

Figure 1: Chain-of-thought prompting enables large language models to tackle complex arithmetic, commonsense, and symbolic reasoning tasks. Chain-of-thought reasoning processes are highlighted.

#### Reflection

## Rethinking engineering methods and contributions

- What part of the design and engineering work can LLMs automate?
- How does the prevalence of generative AI tools impact the way we think about novelty in contributions?
- How might the accelerated development process impact the traditional engineering methods?
- How might this impact the traditional usercentered research process aimed to build adaptive and personalized experiences?

![](_page_8_Picture_7.jpeg)

Includes novel techniques Achieves novel functionality

**Figure 3: Interactive systems that include both novel functionality** (i.e., the outer *what*) and novel techniques (i.e., the inner *how*) can often be motivated and validated in either contribution.

![](_page_8_Picture_11.jpeg)

Includes known techniques

Achieves novel functionality

Figure 4: When underlying techniques are known (i.e., the inner *how*), the question is whether their combination in new functionality is a significant contribution (i.e., the outer *what*).

![](_page_8_Picture_16.jpeg)

Includes novel techniques

Achieves known functionality

Figure 5: When applied in known overall functionality (i.e., the outer *what*), the question is whether implications of novel inner techniques are a significant contribution (i.e., the inner *how*).
